HACKATHON PROJECT TITLE

COLLEGE NAME

STUDENT NAME: _____

YEAR: _____

DEPARTMENT: _____

SEMESTER: _____

ROLL NO: _____

NM ID: _____

DATE: _____

1. Use Case and Assumptions

Use Case:

(Describe the web application, its purpose, and target users.)

Your Unique Execution / Approach:

- How will you implement this use case differently or creatively?

Assumptions:

2. Problem Statement

(Highlight the challenges of secure web app hosting, such as unauthorized access, data breaches, misconfigured resources, or performance issues.)

Your Unique Execution / Approach:

- How will you tackle these challenges in your project?

3. Key Points to Consider

Compute:

- Choice of instance type, OS, and scalability.

Your Unique Execution:

What instance type, OS, or setup strategy will you implement differently?

Networking:

- VCN, subnets, routing, security lists/NSGs.

Your Unique Execution:

- How will you design the network or security differently?

Storage:

- Block volume attachment, persistence, and backup.

Your Unique Execution:

- What storage setup or approach will you uniquely implement?

Security:

- Firewall rules, access control, encryption, monitoring.

Your Unique Execution:

- How will you ensure security in a unique or optimized way?

4. High-Level Architecture Diagram

Description: Basic secure web application deployment. Students should **draw their own unique architecture based on their execution plan.**

[VCN / Network]

Your Unique Execution / Approach:

- Explain any modifications or optimizations you made to this architecture.

5. Deployment Steps

Step 1 – Setup Compute Instance:

Your Unique Execution:

- Any unique configuration, OS selection, or optimization:

Step 2 – Attach Block Volume:

Your Unique Execution:

- Any unique volume setup or data management:

Step 3 – Configure Security Rules:

Your Unique Execution:

- Unique firewall rules, NSG configurations, or access control:

6. Secure Connectivity Guidelines

- Restrict SSH to trusted IP addresses only.
- Use key-based authentication instead of passwords.
- Apply principle of least privilege for all users.
- Regularly update and patch servers.

Your Unique Execution:

- How will you apply security in a personalized or enhanced way?

7. Additional Notes / Challenges Faced

Your Unique Execution / Learning:

- What did you implement or learn differently in your project?
